Stockholm, Sweden, January 2010

Swedish challenger turns Google's phone into a security device

The Swedish company Nordic Edge has developed a mobile client, Pledge, which turns Google's new mobile Google Nexus One into a security token. Pledge generates one-time passwords on the device and allows users to use their Google mobile to log in securely to local networks, cloud services or Internet banks.

- By using the mobil phone as a security token, everything becomes so much easier and cheaper - especially for end-users and service providers. Users get an easy and secure login that they always carry with them, while the service provider, for example the bank or the IT-department, can offer a secure and cheap remote access without hardware tokens, says Jim Carlsson, CEO Nordic Edge.

There's a strong demand from many companies and organizations to find secure and user-friendly security solutions in which employees or customers can connect without external hardware tokens, which often is a very expensive solution both from a financial and environment perspective.

- As we manage more and more of our lives through our mobile phone, there is a need for a both secure and user-friendly security solution for our mobile phones. That's the reason why we believe there's a great market potential in Pledge, for both users and service providers.

It's the rapidly growing Swedish technology company Nordic Edge who developed the mobile client Pledge. Pledge creates one-time passwords with so-called two-factor authentication, resulting in a very high login security. The client software can handle multiple simultaneous logins on different servers, so only one client is required on the phone even if the users log on to multiple secure connections simultaneously. Pledge also comes with a signing functionality, so the phone can be used to sign inquiries from, for example, a customer service, or to sign transactions, bid at an auction or supplies.

Nordic Edge has over the past year produced mobile clients for the world's most popular mobile phones such as Blackberry, iPhone and Android phones. Pledge is also available for all Microsoft Windows Mobile-based phones and for phones that support Java Micro Edition (JME).
